

Advanced Programming

COEN 11

Lab 7

Lab 7

- Surf School Waiting List
- Waiting List with File I/O
 - Extension of lab 5 or 6
 - Add saving/retrieving

Lab 7

- Initially
 - The waiting list may be either:
 - Empty or
 - formed with information read from a file
- At the end
 - The updated waiting list is saved into a file

Lab 7

- The info should be saved in a text file according to the following format:

Name	Group Size
------	------------

Joe	5
-----	---

Mary	3
------	---

Zoe	3
-----	---

- It should be possible to read the file with commands such as **cat** and **more**

Lab 7

- The name of the file is an **argument** for the program
 - If the file does not exist
 - **fopen** returns NULL for reading
 - the list starts empty and is saved at the end into a file with the given name
 - If the file does exist
 - the list is initially formed with the information obtained from the file and is saved into the same file at the end

Lab 7

- The name of the file is an argument for the program

- Example:

- # ./wait_list <file_name>

- or

- # ./a.out <file_name>

Lab 7

- The name of the file is the first argument for the program

- In the code:

```
main (int argc, char *argv[])
{
    . . .
    if (argc == 1)
    {
        printf ("The name of the file is missing!\n");
        return 1;
    }

    read_file (argv[1]);
    . . .
}
```

Lab 7

- The name of the file is an argument for the program
 - In the code:
 - `argc` gives the number of arguments
 - `argv` is an array of strings, each of which is one of the arguments for the program
 - `argv[0]` is the name of the executable
 - `argv[1] – argv[argc – 1]` are the arguments

Lab 7

- The waiting list is created/modified interactively, as in lab 5 or lab 6, except that command **quit (zero) will save the info into a file.**
 - quit
 - save the list in the file specified and quit

Lab 7

- Requirements
 - **Two new functions**, called from main
 - Read from file
 - Receive file name as an argument
 - Call the `insert` function to insert the data read from file
 - Save to file
 - Receive file name as an argument

Lab 7

- Requirements
 - Use same `insert` function for inserting information from the file and from the keyboard.
 - Your insert function should have the following type:
`void insert (char *, int);`
 - Read the name and number to local variables (char array and int) before calling the `insert` function.

Lab 7

- Requirements
 - Names cannot repeat!
 - Need to deal with that before calling function insert
 - Use function `fseek` to read the beginning of the file (header) before reading the data (names/numbers).
 - Type `man fseek` to learn how to use the function

Lab 7

- To receive full credit
 - Pre-lab
 - Test plan
 - Demo
 - Show the TA
 - Save to file
 - File is in the correct format
 - Retrieve from file
 - Submit to Camino

End

Lab 7
